

Experiment No.: 2

Title: Demonstrate the use of structures and pointer / class and objects to implement Singly Linked List (SLL).

Batch: A1 Roll No.: 16010423018 Experiment No.:2

Aim: Implementing Singly Linked List (SLL) supporting following operations using menu driven program.

- 1. Insert at the Begin
- 2. Insert after the specified existing node
- 3. Delete before the specified existing node
- 4. Display all elements in tabular form.

Resources Used: Turbo C/C++ editor and compiler (online or offline).

Theory:

Singly Linked List:-

Singly Linked Lists are a type of data structure. It is a type of list. In a singly linked list each node in the list stores the contents of the node and a pointer or reference to the next node in the list. It does not store any pointer or reference to the previous node. It is called a singly linked list because each node only has a single link to another node. To store a single linked list, you only need to store a reference or pointer to the first node in that list. The last node has a null pointer to indicate that it is the last node.

A linked list is a linear data structure where each element is a separate object.

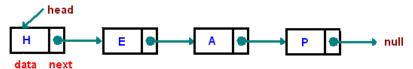

Fig 1.1: Example of Singly Linked List

Each element (we will call it a node) of a list is comprising of two items - the data and a reference to the next node. The last node has a reference to null. The entry point into a linked list is called the head of the list. It should be noted that head is not a separate node, but the reference to the first node. If the list is empty then the head is a null reference.

A linked list is a dynamic data structure. The number of nodes in a list is not fixed and can grow and shrink on demand. Any application which has to deal with an unknown number of objects will need to use a linked list.

One disadvantage of a linked list against an array is that it does not allow direct access to the individual elements. If you want to access a particular item then you have to start at the head and follow the references until you get to that item.

Another disadvantage is that a linked list uses more memory compare with an array - we extra 4 bytes (on 32-bit CPU) to store a reference to the next node.

Algorithm:

Program should implement the specified operations strictly in the following manner. Also implement a support method isempty() and make use of it at appropriate places.

- 1. **createSLL()** This void function should create a START/HEAD pointer with NULL value as empty SLL.
- **2. insertBegin(typedef newelement)** This void function should take a newelement as an argument to be inserted on an existing SLL and insert it before the element pointed by the START/HEAD pointer.
- **3. insertAfter(typedef newelement, typedef existingelement)** This void function should take two arguments. The function should search for an existing element on non-empty SLL and insert newelement after this element.
- **4. typedef deleteBefore(typedef existingelement)** This function should search for the existing element passed to the function in the non-empty SLL, delete the node siting before it and return the deleted element.
- **5. display()** This is a void function which should go through non- empty SLL starting from START/HEAD pointer and display each element of the SLL till the end.

NOTE: All functions should be able to handle boundary(exceptional) conditions.

```
Program: (copy-paste code here)

#include<stdio.h>

#include<stdlib.h>

struct employee

{
    int empID;
    struct employee *next;
}*first, *last, *newrecord, *current;

void insertAtBeginning()

{
```

```
newrecord = (struct employee *) malloc (sizeof(struct employee));
  printf("Enter the empID at Beginning : \n");
  scanf("%d",&newrecord -> empID);
  if(first == NULL)
    newrecord -> next = NULL;
     first = newrecord;
    last = newrecord;
  else
     newrecord -> next = first;
    first = newrecord;
void display()
  current = (struct employee *) malloc (sizeof(struct employee));
  current = first;
  printf("empID are as follows : \n");
  while(current != NULL)
    printf("%d\n",current -> empID);
    current = current -> next;
```

```
void deleteAtBeginning()
  current = (struct employee *) malloc (sizeof(struct employee));
  current = first -> next;
  first \rightarrow next = NULL;
  first = current;
  printf("Updated record is : ");
  display();
void deleteAtEnd()
current = (struct employee *)malloc(sizeof(struct employee));
current = first;
while(current->next != last)
   current = current->next;
current->next = NULL;
last = current;
display();
void deleteInMiddle()
```

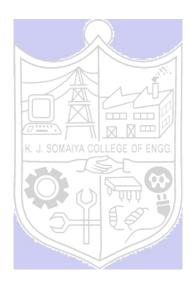

```
current = (struct employee*)malloc(sizeof(struct employee));
  current = first;
  int afterToBeDeleted;
  printf("Enter empID before which data has to be deleted : ");
  scanf("%d", &afterToBeDeleted);
  int deletedNo;
  while(current -> next -> next -> empID != afterToBeDeleted)
    current = current -> next;
  deletedNo = current -> next -> empID;
  current -> next = current -> next -> next;
  printf("Deleted empID is : %d ",deletedNo)
  display();
void insertAfter()
  current = (struct employee *)malloc(sizeof(struct employee));
  newrecord = (struct employee *)malloc(sizeof(struct employee));
  int beforeToBeInserted;
  current = first;
  printf("Enter element to be added after \n");
  scanf("%d", &beforeToBeInserted);
  printf("Enter employee ID to be added \n");
```

```
scanf("%d", &newrecord->empID);
  if (first == NULL)
    printf("The Linked List is empty");
  else
    while(current->empID != beforeToBeInserted)
       current = current -> next;
    newrecord->next = current->next;
    current->next = newrecord;
void createSSL()
  first = NULL;
  last = NULL;
  printf("List created\n");
void main()
```

```
first = NULL;
  last = NULL;
  while(1)
     int ch;
     printf(" 1. Create SSL \n 2. Insert at Beginning \n 3. Insert After a specific employee ID \n
4. Delete before a specific employee ID \n 5. Display\n 6. Exit\n");
     scanf("%d", &ch);
     switch(ch)
          case 1:
            createSSL();
            break;
          case 2:
            insertAtBeginning();
            break;
          case 3:
            insertAfter();
            break;
          case 4:
            deleteInMiddle();
            break;
          case 5:
            display();
            break;
```

```
case 6:
    exit(1);
    default:
        printf("Wrong option, please try again\n");
}
```

Output:

```
Output
                                                                                        Clear
 1. Create SSL
 2. Insert at Beginning
 3. Insert After a specific employee ID
 4. Delete before a specific employee ID
 5. Display
 6. Exit
List created
 1. Create SSL
2. Insert at Beginning
 3. Insert After a specific employee ID
 4. Delete before a specific employee ID
 5. Display
 6. Exit
Enter the empID at Beginning :
 1. Create SSL
 2. Insert at Beginning
 3. Insert After a specific employee ID
 4. Delete before a specific employee ID
 5. Display
 6. Exit
Enter the empID at Beginning :
1. Create SSL
 2. Insert at Beginning
 3. Insert After a specific employee ID
 4. Delete before a specific employee ID
 5. Display
 6. Exit
Enter the empID at Beginning :
```

```
1. Create SSL
 2. Insert at Beginning
 3. Insert After a specific employee ID
 4. Delete before a specific employee ID
 5. Display
6. Exit
empID are as follows :
3
1. Create SSL
2. Insert at Beginning
3. Insert After a specific employee ID
 4. Delete before a specific employee ID
5. Display
6. Exit
Enter element to be added after
Enter employee ID to be added
1. Create SSL
2. Insert at Beginning
 3. Insert After a specific employee ID
4. Delete before a specific employee ID
 5. Display
6. Exit
empID are as follows :
2
```

```
1. Create SSL
2. Insert at Beginning
3. Insert After a specific employee ID
4. Delete before a specific employee ID
5. Display
6. Exit
Enter empID before which data has to be deleted : 3
Deleted empID is : 2 empID are as follows :
3
1. Create SSL
2. Insert at Beginning
3. Insert After a specific employee ID
4. Delete before a specific employee ID
5. Display
6. Exit
6
```

Conclusion:

CO1. Comprehend the different data structures used in problem solving.

CO4. Demonstrate sorting and searching methods.

Outcomes achieved: (refer exp list)

Learnt how to create a menu driven program to use functions involving a Single Linked List.

Grade: AA / AB / BB / BC / CC / CD /DD
